

NVMD vs classical VMD: what the decomposition actually contains

SA1 half-hourly price, $W=96$, train 2018 / test 2019. VMD is the tuned sweep winner ($\alpha=1000$, $K=8$), not the untuned literature config.

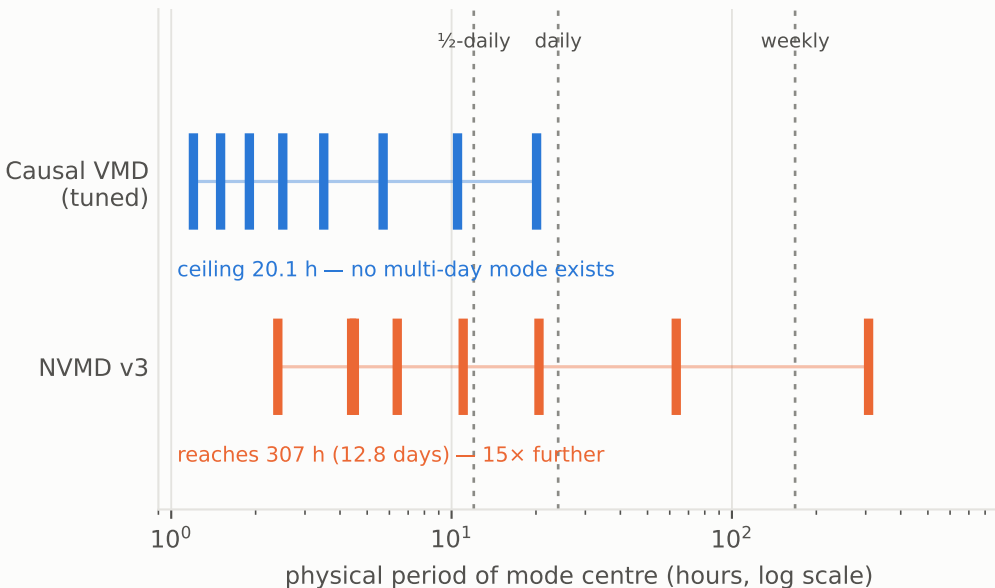

A Bands vs smears

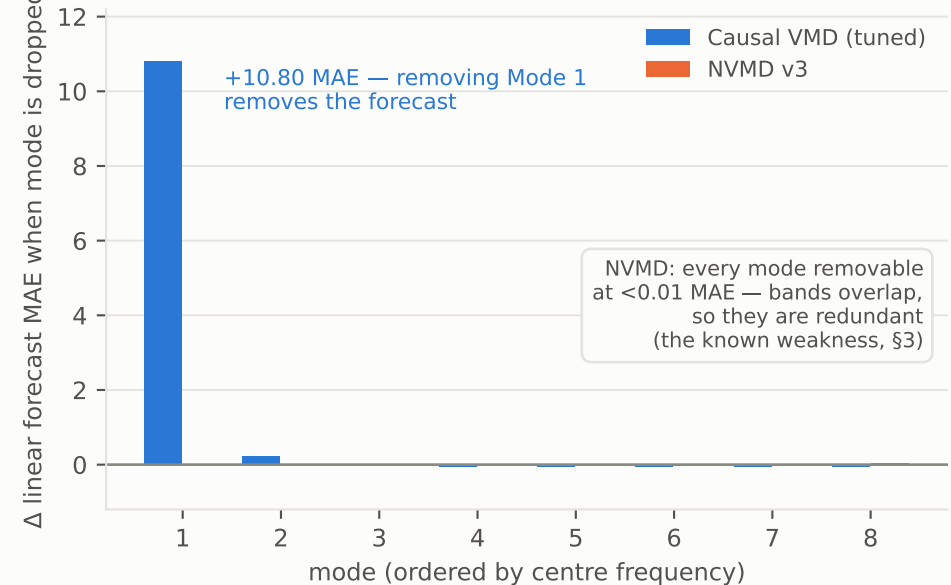

B One mode, or many?

C What the modes can represent

D Is any single mode load-bearing?

A–C: NVMD gives ordered, non-overlapping-in-scale bands spanning DC to 2.4 h; VMD gives a flat bandwidth that smears its lowest mode across 77% of the energy. D is the honest counterweight: NVMD's bands overlap, so no single NVMD mode is load-bearing either — it wins on structure and coverage, not on ablation.
